Phase 1 brief: the ticket page

For Leena, support lead

Phase 1 rebuilds the legacy ticket page for one ticket, T00727, on the new desk under Orion branding. It changes no behaviour. Four must-stay rows from the backlog prove it: M01, M02, M04 and M05. Each is tested on the ticket page for T00727.

The four must-stay rows

Row	What is tested	What it keeps for your agents
M01	Opening **/tickets/T00727** shows ticket T00727 and no other ticket.	Every ticket keeps its ID, and exact lookup by ID stays. An agent who opens a ticket gets that ticket.
M02	The page shows customer C0086 (Fern Platform 086) and all 5 messages, M007386 to M007390, oldest first.	A ticket stays linked to its customer and its full message history, so an agent sees who raised it and what was said, in order.
M04	Every control on the ticket page can be reached and used with the keyboard alone. Body text meets a contrast of at least 4.5:1.	Agents can work the ticket without a mouse, and the text stays readable.
M05	Every page that exists in Phase 1 shows the Orion orbit mark and the company name.	The desk still looks like Orion, with the same identity agents already know.

Open assumptions

These are guesses, not decisions. If one is wrong, the requirement it touches changes. Assumptions 2 and 3 need a decision.

#	Guess	How to check
1	Phase 1 ships only the ticket page for T00727, so M05 is tested on that page alone.	Confirm no other page ships in Phase 1.
2	"Readable text" means body text contrast of at least 4.5:1 (WCAG AA). The backlog gives no measure.	Agree a measure, then test against it.
3	M02 is met by showing C0086's summary on the ticket page. The customer page comes later, so the link to it may not work in Phase 1.	Decide whether the link must work in Phase 1. If yes, the customer page moves into Phase 1.
4	The expected values (C0086, 5 messages M007386 to M007390) stay true because the lab data does not change.	Compare counts and a checksum of the tickets and messages tables on two occasions.
5	Phase 1 starts once ADR 0001 is accepted and Phase 0's checks pass. The ADR is still Proposed.	Check the ADR's status before starting.

Not in Phase 1

Search by ID (Phase 4). Flagging a missed resolution target: the legacy page never does, and whether to change that is undecided. Must-stay rows M03 and M07, proved in later phases. Production database, hosting and cut-over.
